Morpheus® II 10 mL, HT-96 and FX-96 pre-filled plate. MD1-91, MD1-92 and MD1-92-FX

Morpheus II is optimized to yield crystals not observed in traditional screens and also includes heavy atoms for experimental phasing as well as polyols for cryoprotection.

MD1-91 is presented as 96 x 10 mL conditions *(includes 12 x 15 mL glass bottles containing polyamine powders[1] to mix with water)*. MD1-92 is presented as 96 x 1 mL conditions / MD1-92-FX is presented as 96 x 100 µL conditions.

Features of Morpheus II:

- Targeted incorporation of 35 low- molecular weight PDB ligands into 96 conditions.
- Incorporation of heavy atoms as additives for experimental phasing.
- Suitable for membrane proteins with PEGS and polyols as main precipitants.
- The inclusion of NDSBs, polyamines, amino acids and monosaccharides to enhance solubility and stability of many proteins for crystallization.
- New polyols included for cryoprotection of conditions: no need to investigate more conditions for cryo-cooling.
- Innovative buffer systems facilitate pH optimization.
- Readily available Morpheus® II Optimization reagents including the Mixes and Stock reagents.

Introduction

Morpheus II is a follow up to the original screen that was used with success in many laboratories. **Morpheus II** integrates reagents that are not seen in other screens, especially less common additives. As a consequence, the screen should have an impact not only on crystallisation but also on the overall structure determination process.

Morpheus II follows the general design principles of the original Morpheus screen. However, less typical additives have been included, such as heavy metals, NDSBs, polyamines, amino acids and monosaccharides. In addition, various polyols have been added for cryoprotection along with innovative buffer systems.

Some additives such as metal divalent cations can induce new crystal contacts. Also, heavy atoms were integrated to help with *ab initio* structure determination since a common issue to solve novel structure is the phase problem.

Most of the other additives are meant to alter protein stability and solubility (carboxylic acids, polyamines and monosaccharides).

[1] The mix of polyamines must be prepared and added to the 12 corresponding tubes by the user, hence only the raw chemicals are present in the screen kit (powder mix is given in a 15 ml glass bottle in order to prepare 13 ml using ultrapure water).

Screen Design
Morpheus II is based on the 3D grid design of Morpheus. The 35 PDB-derived ligands selected to formulate Morpheus2 are shown in Table 1. From these, eight additive mixes were prepared (Table 2): LiNaK, Divalents II, Alkalis, Oxometaltes, Lanthanides, Monosaccharides II, Amino acids II and Polyamines.

Formulation Notes
Morpheus II reagents are formulated using ultrapure water (>18.0 MΩ) and are sterile-filtered using 0.22 µm filters. No preservatives are added.

PLEASE NOTE
The polyamine mix must be prepared and added to the 12 corresponding tubes by the user. The raw chemicals in a powder mix are provided in the kit in a 15 mL glass bottle. Sufficient ultrapure (>18.0 MΩ) water should be added to this bottle to make up a 13 mL solution.
A light pellet may form in tubes 2-1 to 2-12/well numbers B-1 to B-12 which contain Lanthanides (2-1 to 2-12). It is easily re-suspended with gentle mixing.

The screen should be kept between 10-18 °C and gently mixed before use.

Final pH may vary from that specified on the datasheet. Molecular Dimensions will be happy to discuss the precise formulation of individual reagents.

Individual reagents and stock solutions for optimization are available from Molecular Dimensions.

Contact and product details can be found at www.moleculardimensions.com
Enquiries regarding Morpheus II formulation, interpretation of results or optimization strategies are welcome. Please e-mail, fax or phone your query to Molecular Dimensions.

Morpheus II Optimization

Although the screen is composed of various mixes, consider each condition as for any other screen, with three stock solutions:

- mix of precipitants
- mix of additives
- mix of buffers.

When you have more than one hit, you can deduce the importance of each stock from the beginning: e.g. Do I see specificity related to one stock? To pH?

Every condition can be made following the same ratio of stock solutions:

1/2 [Precipitant mix] + 1/10 [additive mix] + 1/10 [Buffer system] + 3/10 dH_2O.

To vary the pH, you can change the ratio of the two buffers within the buffer stock (i.e. change ratio of two non-titrated 1M buffer stocks).
Once you know more about the chemical space within Morpheus II you can eventually investigate further, trying to reveal specificity of a single chemical.
For example, what happens when you replace the group of chemicals from a stock with only one chemical of this mix? (e.g. only one divalent cations instead of the corresponding mix of additives).

At this stage you may (or not) have a simpler condition to work with. You can also proceed to other "classic" optimization approaches such as using an additive screen, scale-up or seeding.

Table 1: List of PDB ligands in Morpheus II

PDB ligand name	Class	PDB ID (main)	No. of structures*
Lithium sulfate	Common salt	LI	51
Sodium chloride	Common salt	NA	4726
Potassium sulfate	Common salt	K	1638
Manganese chloride tetrahydrate	Divalent cation	MN	1938

Screen should be stored between 10-18°C and gently mixed before use

*A light pellet may form in tubes 2-1 to 2-12/well numbers B-1 to B-12 which contain Lanthanides (2-1 to 2-12). It is easily re-suspended with gentle mixing.

†The polyamine mix must be prepared and added to the 12 corresponding tubes by the user. The raw chemicals in a powder mix are provided in the kit in a 15 mL glass bottle. Sufficient ultrapure (>18.0 MΩ) water should be added to this bottle to make up a 13 mL solution.
